The value of color
Rethinking productivity

Productivity in the construction business

Low productivity has been a constant drumbeat in the construction industry, raising costs and adding risk and waste across project lifecycles. Industry leaders are looking for ways to drive risk and waste out of their own project-delivery processes, and they see many opportunities for improvement across the range of engagements.

Based on The Economist, “Rethinking productivity across the construction industry: The challenge of change,” (2015), a survey revealed that:

- 74% of construction professionals surveyed indicate that lagging productivity is a major challenge
- 48% believe that their firms have failed to come up with a coherent strategy to address this problem
- 32% cite poor communication and collaboration as one of the leading obstacles to partner-related productivity, underscoring the need for better partnership models between contractors, clients, and investors

Construction Labor Productivity

Errors and waste are common in the industry

Waste is costly

According to the Lyra Research Inc. article "Color Construction Documents: A Simple Way to Reduce Costs, general industry estimates that between 10 and 30% of all building project costs can be attributed to wasted activities, such as schedule overruns due to inaccurate coordination scheduling, wasted labor and management time, wasted materials, and unnecessary litigation.

Based on U.S. Department of Commerce building estimates for 2009, a 10% waste factor is equal to approximately $94 billion.”

Unforced human error results in consequences

- Wasted material when building
- Wasted operator time
- Wasted time for manager to make corrections
- Time delay of the project due to the error
- Reprint of the plot with the corrections
- Litigation with the project lead

Studies suggest that between 70 and 90% of projects exceed the original planned cost, and the overrun commonly reaches between 50 and 100% of the budget. 21% of the time, poor exchange of information and communication causes errors at work.¹

The AEC construction workflow: tasks and priorities

Low-productivity consequences

<table>
<thead>
<tr>
<th>Role</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Project owner</strong></td>
<td>A major concern is closing the project on time with no extra costs. Any delay in the project delivery is most likely to result in extra costs.</td>
</tr>
<tr>
<td><strong>Architect</strong></td>
<td>Focused on transmitting attractive ideas and appealing designs when planning and designing. Providing misleading information can delay the entire project execution.</td>
</tr>
<tr>
<td><strong>General contractor</strong></td>
<td>A primary task is monitoring and controlling the implementation of the project. Any error when transmitting information can result in litigation, and additional costs and delays with the project owner.</td>
</tr>
<tr>
<td><strong>Subcontractor</strong></td>
<td>Subcontractors are focused on delivering on requests as quickly and accurately as possible, minimizing errors. Information errors can result in rework and time delays and penalties from the general contractor.</td>
</tr>
</tbody>
</table>

AEC industry trends

**Building information modeling (BIM)**
BIM is an integrated process that allows professionals to explore a project’s key physical and functional characteristics digitally before it is built.

**Integrated project delivery (IPD)**
IPD is the alliance and collaboration of all agents of a project. The benefit of this delivery method is that it spreads the risk equally among all parties involved in the build. All parties are focused on a common bottom line which means increased pressure to maintain accuracy and manage waste.

**Mobility**
With the technology currently available, more time is spent on the road and the use of smart phones and tablets is ubiquitous. Documents are stored using cloud services, and companies must frequently access and print drawings from anywhere. Plans and documents require accuracy and constant corrections from different locations.

**The need to differentiate**
Public investment has declined since 2008 while competition has increased. With more competition in the market, it’s more difficult to win bids. From the bidding process to delivering the final construction documents, improvement is needed in all areas to address the competitive environment.
The advantages of printing in color

Color printing has become an important component in projects because it can decrease human error rates. It has been proven that color documents are more easily understood and the information is retained at higher rates versus monochrome documents.²

The use of color documents reduces errors and allows a team to easily understand the sections of a plan for which they are responsible. During the bidding phase, color documents make a more professional impression than monochrome documents.

Throughout the project, the use of color in documents can help keep the project on time and on budget.

Color is effective:

By the numbers

In up to 65% of the cases, color documents are more easily understood and the information is retained at higher rates versus monochrome documents¹.

Up to 80% errors reduction due to the use of color documents³.

Color drafts reduce failure cost on building site by 3.9%⁴.

Around 0.25% of the costs of the project¹⁵ are typically construction documentation costs.

$1 invested in color printing can yield $4 in savings for a given project¹⁵.

Color adoption is increasing

What do you expect in terms of color adoption in your company in the next year? InfoTrends, 2014 LED market research found:

- Increase 50%
- Decrease 13%
- Remain stable 37%
Now you can see a high return on your investment—print in color!

$1 invested in color printing can yield $4 in savings for a given project.

The following example demonstrates the potential return on investment (ROI) of printing in color compared to printing in monochrome.

---

Summary

Here’s what customers have to say:

“Working with color printouts is easy. We need less prints when in color, both for the client and internal use.”

“We would use more color printing. Clients visualize 3D easier in color.”

“The drawings are getting more and more complicated because we don’t draw by hand anymore, we use ArchiCAD and more and more plans will, therefore, have to be in color as they are impossible to read otherwise and everything has its own color—like all electrical things are yellow, all waterpipes are blue and so on.”

“It will be easier and faster. I will have better definition and simpler drawings using color.”

“Imagine a drawing of a house which is going to be altered. Color drawings can give everyone their own color—for instance, the builder is green and he knows that all green lines refer to him, and the electrician is yellow and he can pick out his lines as well. That means I don’t have to do several drawings for different people and they can all see the complete picture and pick.”
